

CASE STUDY

ISL's Agile, Immediate Response Ensures Minimum Disruption to Client Timeline.

WAREHOUSING

DISTRIBUTION

INVENTORY MANAGEMENT

Challenge

A rapidly expanding Independent Connection Provider (ICP) in the UK approached ISL with an urgent logistics requirement. The company needed to transport a 2 MVA substation and GRP housing from Yorkshire to London.

The movement required a special order due to the abnormal load size, and no other provider could fulfill the request within the tight timeframe. Upon arrival, the site was not ready for installation, as the ground was uneven and 20 tonnes of spoil needed to be removed before the substation could be placed on the plinth.

Solution

The ICP reached out to ISL's specialist team who responded within minutes of the request and was able to mobilise within 48 hours. The logistics process was managed from beginning to end, ensuring compliance with all movement regulations, including liaising with the police and handling an enforcement notice.

Despite the unexpected site complications, ISL quickly arranged for diggers and equipment to clear the spoil, making the site suitable for installation. The project was completed on time with collection on Monday morning and successful delivery by Tuesday as scheduled.

Result

Thanks to ISL's expertise and advanced digital delivery software, the project manager received real-time proof of delivery with photographic evidence.

The substation was successfully delivered at the charging site, ensuring minimal disruption to the ICP's project timeline.

ISL is committed to delivering critical infrastructure on time and without complications, even under demanding conditions.
